

# INTEGRATION MANUAL

## SHIPMENT PICKUP LOCATION WIDGET

### 1. Requirements

JavaScript support is mandatory for widget to work properly with application.

### 2. Standard integration

In order to use Widget on merchant ecommerce platform, script below must be included to html page.  
**IMPORTANT! Do not copy this link to your server, it should be linked to our server.**

Example:

```
<script  
src="https://mapa.ecommerce.poczta-polska.pl/widget/scripts/ppwidget.js "></script>
```

Then you must execute function toggleMap: PPWidgetApp.toggleMap({callback: callbackFunc})

callbackFunc is a function that is executed when user chooses shipment pickup location from widget map. Object is being passed to callback function as, a parameter: callbackFunc(wybranyPunkt).

Sample object:

```
{city: "Warszawa",  
description: "dni robocze: 08:00-15:00#soboty: 09:00-12:00#niedziele i święta: placówka  
nieczynna#Placówka dostosowana do potrzeb osób niepełnosprawnych.#", ekspres24: true,  
kurier48: true,  
latitude: 52.231676,longitude: 21.005997,name: "FUP Warszawa 1", paczkaEkstra24: true,  
phone: "22-620-33-84 #jedn. nadrzędna: UP Warszawa 1#tel.: 22-505-35-34, 22-505-32-18",  
pni: "995721",province: "MAZOWIECKIE", street: "Plac Defilad 1",type: "POCZTA",zipCode:  
"00-901"}
```

Callback function must be implemented by the ecommerce platform owner. Implementation employs shipment pickup location information in order to finalize order. Ecommerce platform has information to where order should be delivered.

### 3. Additional parameters

Default behaviour of widget can be override by additional parameters. It helps to improve user experience, and shortens path to shipment pickup location.

- **Cash on delivery**

Starting widget with additional parameter payOnPickup=true, filters available points to those that offer cash on delivery service. Currently those are only Poczta Polska points.

example:

```
var pobranie = true;
PPWidgetApp.toggleMap({callback: callbackFunc, payOnPickup: pobranie,});
```

- **Address**

Starting widget with additional parameter address, shows points within area defined by given address. User does not have to input any data to have point on the map.

example:

```
var pobranie = true;
var adres = "Rodziny Hiszpańskich 8, Warszawa, Polska";
PPWidgetApp.toggleMap({callback: callbackFunc, payOnPickup: pobranie, address: adres,});
```

- **Pickup point types**

Parameter "type" defines pickup point types that are displayed on a map. You can choose from those types.

- POCZTA – placówki Poczty Polskiej (post office)
- ORLEN – stacje paliw Orlen (petrol station)
- AUTOMAT\_POCZTOWY – automaty pocztowe Poczty Polskiej (parcel locker)
- RUCH – kioski Ruchu (newsagent store)
- ZABKA – sklep Żabka (Zabka grocery)
- FRESHMARKET – sklep Freshmarket (Freshmarket grocery)
- AUTOMAT\_BIEDRONKA - automaty Biedronka (Smartbox - parcel locker at Biedronka grocery)
- AUTOMAT\_CARREFOUR - automaty Carrefour (Smartbox - parcel locker at Carrefour)
- AUTOMAT\_PLACOWKA - automaty pocztowe Poczty Polskiej (Smartbox - parcel locker at post office)
- AUTOMAT\_LEWIATAN – automaty Lewiatan (Smartbox)
- AUTOMAT\_SPOLEM – automat Społem (Smartbox)

Example:

```
var pobranie = true;
var adres = "Rodziny Hiszpańskich 8, Warszawa, Polska";
var typy = ["POCZTA", "ORLEN", "AUTOMAT_POCZTOWY"];
PPWidgetApp.toggleMap({callback: callbackFunc, payOnPickup: pobranie, address:
adres, type: typy});
```

Types parameter overrides payOnPickup value. Even though payOnPickup is true, and types includes point types that do not have this service, they will be displayed on a map.
